

## Task 5

| Feature / Module        | Impact (1-5) | Likelihood (1-5) | Risk Score | Test Priority | Justification                                                                                                                                          |
|-------------------------|--------------|------------------|------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| Sign Up / Login         | 5            | 5                | 25         | Critical      | Authentication is the entry point to the application. Any issue with sign-up or login prevents users from accessing their accounts and placing orders. |
| Outlet Selection        | 4            | 4                | 16         | High          | Users must select the correct outlet before browsing the menu. An incorrect outlet may display the wrong menu, pricing, or delivery options.           |
| Order Now / Search      | 5            | 4                | 20         | High          | Searching and browsing food items is one of the most frequently used features. Any issue here directly affects the user's ability to place an order.   |
| Cart (Add/Remove Items) | 5            | 5                | 25         | Critical      | The cart manages selected items, quantities, and pricing. Errors can result in incorrect orders, pricing issues, or customer dissatisfaction.          |
| Checkout / Payment      | 5            | 5                | 25         | Critical      | This is the most business-critical module. Any failure during checkout or payment can prevent order completion and directly impact business revenue.   |
| Order History           | 3            | 2                | 6          | Low           | Order history is useful for users to review previous orders but does not affect the core ordering process, making it a lower testing priority.         |
