

Task 6

Test Summary Report

Project: Delivergate

Tester: Sithmi Mallikahewa

Environment: Google Chrome, Microsoft Edge, Apple iPhone (iOS), Windows 11

1. Scope and Environment Tested

The testing covered the main user flows of the Delivergate Demo Webshop including outlet selection, user login, food search, cart management, checkout validation, cross-browser compatibility, responsive behaviour, and basic API verification using browser developer tools.

Browsers: Google Chrome, Microsoft Edge

Device: Windows 11 PC and Apple iPhone

Testing Period: 16 - 20 July 2026

2. Test Execution Summary

Metric	Count
Total Test Cases	14
Executed	14
Passed	11
Failed	3
Blocked	0
Execution Rate	100%

3. Defect Summary

Severity	Count
High	2
Medium	5
Low	1
Total	8

Top 3 Most Impactful Issues

- Users cannot remove individual cart items

Removing a single item clears the entire cart, affecting the shopping experience.

- Past dates can be selected for Dine-In reservations

The reservation calendar allows past dates and times, which can result in invalid bookings.

- Selected outlet not displayed on mobile

After selecting an outlet, the mobile header does not show the chosen outlet, unlike the desktop version.

4. Overall Risk Assessment and Recommendation

The testing showed that the most critical areas of the application are **Sign Up/Login, Cart, and Checkout/Payment**, as these features are essential for users to successfully place an order. Any issues in these modules could have a direct impact on customer satisfaction and business operations. Most of the core features functioned correctly during testing. However, several issues were identified, mainly in the mobile version, affecting usability and consistency. While these issues do not prevent the application from functioning, they should be resolved to provide a better user experience.

5. Suggestions for Improvement

- Product Improvements
 - Allow users to remove individual cart items.
 - Add quantity increase/decrease controls in the cart.
 - Prevent selection of past dates in reservations.
 - Fix responsive layout issues and mobile UI inconsistencies.
 - Correct broken social media links and App Store/Google Play badges.
- Process Improvements
 - Include cross-browser and responsive testing in every release.
 - Perform regression testing before deployment.
 - Expand API validation for critical workflows.
 - Automate high-risk scenarios such as login and cart operations.
